

V3 empirical study · Instruction

Six models · three underlyings · twelve expiry windows · 7-day hourly calibration

What this report is

- Computational source of truth: the companion Jupyter notebook. This PDF is written from the same payload; every table number is identical.
- Question: which of six American-call pricing models tracks listed market prices most closely, and does the ranking change across companies and the twelve expiry windows?
- In every table the BEST row is the lowest percentage RMSE. That row is bold and shaded green, and the Mark column ranks 1–6 (1 = lowest RMSE%).

Experimental design (held fixed for every model)

- Models: GBM, GARCH(1,1), Heston (no jumps), Merton jump-diffusion, GARCH–Merton, Heston–Merton (Bates).
- Companies: SPY (primary), AAPL, MSFT. Each name is calibrated and priced separately.
- Windows: twelve monthly third-Friday expiries (Oct 2022–Sep 2023). Evaluation is the Friday immediately before expiry, not the expiry Friday itself.
- 1-day study = that Friday. 7-day study = five NYSE sessions ending that Friday. This report is the 7-day study: the five NYSE sessions ending that Friday (35 hourly stamps; Labor Day week = 1, 5, 6, 7, 8 Sep).
- Calibration window: 7-day of 1-minute RTH equity returns and listed quotes ending at each hourly update (09:59–15:59). Parameters estimated at t use only data with timestamp $\leq t$ (no look-ahead).
- If history is shorter than the requested lookback (first hours of 10 Oct 2022), the estimator uses all available 1-minute observations up to t (equity file starts 2022-09-30).

V3 empirical study · Instruction (continued)

Six models · three underlyings · twelve expiry windows · 7-day hourly calibration

Shared market sample and filters (not model-specific)

- For each company × window, one listed-call sample is drawn once and reused by all six models: nearest-ATM call as-of each hourly evaluation timestamp (09:59, 10:59, 11:59, 12:59, 13:59, 14:59, 15:59), DTE 7–60, listed expiry.
- LSM does not run on a 15-minute or 5-minute quote grid. Friday 15:59 is listed as a scheduled stamp but `remaining_horizon = 0`, so LSM is skipped (at least two MC steps required). RMSE% uses only timestamps with a valid remaining horizon.
- Estimation filters, applied in order to every quote used for Heston/Heston–Merton calibration and to the LSM comparison set: (1) calls only, finite S, K, C; (2) no-arbitrage $C \geq \max(0, S-K)$; (3) $7 \leq \text{DTE} \leq 60$; (4) $|S/K - 1| \leq 10\%$; (5) premium ≥ 0.05 , valid bid–ask with relative spread $\leq 50\%$ when those columns exist, volume ≥ 1 when present.
- Return-based models (GBM, Merton, GARCH, GARCH–Merton) never see option quotes in §4; they still price the same filtered LSM contracts in evaluation.

Model-correctness adjustments (V3)

- Heston / Heston–Merton: ($\kappa, \theta, \xi, \rho, v_0$) are option-implied Fourier NLS (Albrecher little-trap), not Method A realized-variance moments. μ is the P-measure lookback mean of stock returns; LSM replaces $\mu \rightarrow r$.
- Euler ordering: the stock increment over $[t, t+\Delta t]$ uses the current variance v_t ; $v_{t+\Delta t}$ is updated afterwards. No look-ahead in the variance.
- LSM: Longstaff–Schwartz American call on the full path cloud ($n_{\text{paths}} = 10000$, seed 42). $n_{\text{steps}} = \text{remaining MC steps from } t \text{ to window Friday 15:59, not listed DTE}$. $\Delta t = 5$ minute(s). Paths are not averaged before stopping. Do not extend paths to listed expiry.

Metrics

- Primary: $\text{RMSE\%} = 100 \times \sqrt{\text{mean}(((C_{\text{model}} - C_{\text{mkt}}) / C_{\text{mkt}})^2)}$. Ranking uses this number only.
- Secondary: $\text{MAE} = \text{mean } |C_{\text{model}} - C_{\text{mkt}}|$ (dollars). $\text{Bias \$} = \text{mean}(C_{\text{model}} - C_{\text{mkt}})$ (dollars). $\text{Bias\%} = 100 \times \text{mean}((C_{\text{model}} - C_{\text{mkt}})/C_{\text{mkt}})$. Positive bias = model expensive vs market. Early-exercise fraction = mean share of LSM paths that stop before the window

5	GBM	91.11	99.89	3
6	Merton	91.11	99.88	0

Table S2 · Wins by company (lowest RMSE% in that company×window)

Model	SPY wins	AAPL wins	MSFT wins	Total
GBM	1	0	2	3
GARCH	0	0	0	0
Heston	5	5	5	15
Merton	0	0	0	0
GARCH-Merton	0	0	0	0
Heston-Merton	6	7	5	18

Table S3 · Mean RMSE% by window (equal-weight mean of SPY / AAPL / MSFT)

Model	Oct22	Nov22	Dec22	Jan23	Feb23	Mar23	Apr23	May23	Jun23	Jul23	Aug23	Sep23	Mean of 12
GBM	68.39	86.05	83.19	75.82	97.97	87.73	94.38	99.76	100.00	100.00	100.00	100.00	91.11
GARCH	68.15	85.81	83.19	75.86	98.31	87.41	94.43	99.80	100.00	100.00	100.00	100.00	91.08
Heston	50.69	79.76	67.23	74.29	92.62	64.82	85.38	97.92	99.27	99.40	99.87	99.98	84.27
Merton	68.38	86.09	83.15	75.88	98.00	87.70	94.37	99.75	100.00	100.00	100.00	100.00	91.11
GARCH-Merton	67.87	85.61	82.71	75.83	98.18	87.03	94.27	99.77	100.00	100.00	100.00	100.00	90.94
Heston-Merton	50.53	79.72	67.15	74.33	92.64	64.60	85.33	97.90	99.28	99.40	99.87	99.98	84.23

Green row in S1 / S3 = lowest mean RMSE%. Green row in S2 = most company×window wins. A model can win the most cells without having the lowest average error (and vice versa).

Summary by company · mean RMSE% across twelve windows

Table S4.1 · SPY

Model	Mean RMSE%	Median # windows best	
GBM	97.45	100.00	1
GARCH	97.34	100.00	0
Heston	93.22	98.91	5
Merton	97.45	100.00	0
GARCH-Merton	97.29	100.00	0
Heston-Merton	93.17	98.87	6

Table S4.2 · AAPL

Model	Mean RMSE%	Median # windows best	
GBM	92.22	98.27	0
GARCH	92.21	98.59	0
Heston	82.39	88.24	5
Merton	92.20	98.23	0
GARCH-Merton	91.99	98.41	0
Heston-Merton	82.34	88.23	7

Table S4.3 · MSFT

Model	Mean RMSE%	Median # windows best	
GBM	83.65	97.60	2
GARCH	83.69	97.96	0
Heston	77.20	91.16	5
Merton	83.68	97.68	0
GARCH-Merton	83.53	97.79	0
Heston-Merton	77.17	91.15	5

Each column is one company. Green row = lowest mean RMSE% across the twelve Friday-before-expiry windows for that name.

Figure 1 · RMSE% by model and window · mean of SPY / AAPL / MSFT

Outlined bar = lowest mean RMSE% in that window. Equal-weight mean of the three companies.

Figure 1 · RMSE% by model and window · mean of SPY / AAPL / MSFT

Outlined bar = lowest mean RMSE% in that window. Equal-weight mean of the three companies.

Figure 1 · RMSE% by model and window · mean of SPY / AAPL / MSFT

Outlined bar = lowest mean RMSE% in that window. Equal-weight mean of the three companies.

Figure 2 · RMSE% by model · each company (mean across twelve windows)

Outlined bar = lowest mean RMSE% for that company.

Figure 3 · Model rank by company × window (1 = best RMSE%)

Green / 1 = lowest RMSE% in that company×window cell. Rankings can and do change across names and windows.

Final analysis

Which models perform best, and does the ranking change?

- On mean percentage RMSE across the 36 company×window cells, Heston–Merton is the best overall model (mean RMSE% = 84.23; 18 of 36 cells).
- Second overall is Heston (mean RMSE% = 84.27; 15 cells).
- The ranking is not stable. Best-in-cell models across the 36 tables: GBM, Heston, Heston–Merton.
- SPY: lowest mean RMSE% is Heston–Merton (93.17); wins 6 of 12 windows.
- AAPL: lowest mean RMSE% is Heston–Merton (82.34); wins 7 of 12 windows.
- MSFT: lowest mean RMSE% is Heston–Merton (77.17); wins 5 of 12 windows.
- Jump models as a group have lower mean RMSE% (88.76) than the three no-jump models (88.82).
- These conclusions are conditional on the V3 filters, 7-day hourly calibration, nearest-ATM hourly sample, LSM with 10000 paths and 5-minute steps to Friday 15:59, and American-call quotes only. They are not a statement about European options or other tenors.

How to read the 36 detailed tables

- Each of Tables SPY-1...MSFT-12 uses exactly the same option contracts for all six models. Differences are the dynamics, not the sample.
- Mark 1 is always lowest RMSE%. MAE, Bias \$, Bias%, and early-exercise are reported, not used for the ranking.
- A model that is Mark 1 on RMSE% can still be biased (systematically expensive or cheap).
- Early-exercise fractions are a model implication, not an accuracy score; LSM stops at window Friday close, not listed expiry.
